Preface

The article is desiged to study financial anomalies

1 Introduction

Fama and MacBeth (1973) : Two-parameter risk-return regression equation is based on Equation 1:

$$x_{im} \equiv \frac{\text{total market value of all units of assets } i}{\text{total market value of all assets}} \tag{1.1}$$
$$\text{where asset}(i)\text{in the portfolio}(m)$$

Equation 1 refers to the market equilibrium (market portflio) is always efficient (Black (1972)).

Excepted Return is given by Equation 1, β_i is the risk of the asset i of the portfolio m, measured relative to $\sigma^2(\tilde{R}_m)$

$$E(\tilde{R}_i) = \left[E(\tilde{R}_m) - S_m\sigma(\tilde{R}_m)\right] + S_m\sigma(\tilde{R}_m)\beta_i, \tag{1.2}$$

$$\text{where,} \tag{1.3}$$

$$\beta_i \equiv \frac{cov(\tilde{R}_i, \tilde{R}_m)}{\sigma^2(\tilde{R}_m)} = \frac{\sigma_{j=1}^N x_{jm}\sigma_{ij}}{\sigma^2(\tilde{R}_m)} = \frac{cov(\tilde{R}_i, \tilde{R}_m)\sigma(\tilde{R}_m)}{\sigma(\tilde{R}_m)}$$

$$S_m = \frac{E(\tilde{R}_m) - E(\tilde{R}_0)}{\sigma(\tilde{R}_m)} \tag{1.4}$$

$$\text{hence} E(\tilde{R}_i) = E(\tilde{R}_0) + \left[E(\tilde{R}_m) - E(\tilde{R}_0)\right]\beta_i$$

Hence, Equation 1 refers that expected return on security i is $E(\tilde{R}_0)$, the expected return on a security that is riskless in the portfolio m, plus a risk premium that is β_i times the difference between $E(\tilde{R}_m)$ and $E(\tilde{R}_0)$

2 Summary

In summary, this book has no content whatsoever.
